SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 01 OF 10

Create Salesforce Objects and Fields

Create the custom Salesforce objects that will store the information used by Swift Ship Tracker.

What to do

1. Open Salesforce Setup.

2. Go to Object Manager and select Create → Custom Object.

3. Create Sender, Receiver, Parcel and Delivery objects. Use API names Sender__c, Receiver__c, Parcel__c and Delivery__c.

4. For each object, add the fields it needs. Sender and Receiver should include contact and address details. Parcel should include tracking number, weight, booking date and status. Delivery should include assignment and delivery progress details.

5. Save each object and field, then confirm that each object appears in Object Manager.

Expected result
You should have four custom objects available in your Salesforce org. The objects and fields form the foundation for the rest of the project.

Complete this step and verify the expected result before moving to the next step.
