SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 02 OF 10

Establish Relationships Between Objects

Connect the records so Salesforce can identify who sent a parcel, who will receive it and how delivery is progressing.

What to do

1. Open Object Manager → Parcel → Fields & Relationships → New.

2. Create a relationship field to Sender__c. Choose Lookup or Master-Detail based on your ownership and sharing requirements.

3. Create another relationship field on Parcel__c to Receiver__c.

4. Open Delivery__c and create a relationship field to Parcel__c.

5. Add an Assigned Agent field that references a Salesforce User or an Agent custom object, depending on your design.

6. Save and test by creating sample Sender, Receiver, Parcel and Delivery records and checking their related-record links.

Expected result

A parcel should show its sender and receiver. A delivery record should point to the parcel it belongs to.

Complete this step and verify the expected result before moving to the next step.
