SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 03 OF 10

Create the Customer Booking Interface

Build the screen customers or a staff member can use to enter a new parcel booking.

What to do

1. Decide whether the first version will use a Salesforce Screen Flow, Experience Cloud page or another approved customer-facing interface.

2. For a Screen Flow, open Setup → Flows → New Flow and select Screen Flow.

3. Add screen components for sender details, receiver details, pickup and delivery addresses, parcel type and weight.

4. Add required-field checks and clear labels so users know what information to enter.

5. Create a review/confirmation screen before saving the booking.

6. Save, activate and test the interface with sample details. For an external customer portal, configure access and authentication before exposing it publicly.

Expected result
A user can enter all required booking details and reach a confirmation step without manually editing Salesforce records.
