SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 04 OF 10

Build Parcel Booking Flows

Automate the creation of parcel records and the generation or assignment of a tracking number.

What to do

1. Open the booking Screen Flow created in the previous step.

2. Add Get Records elements if you need to find existing Sender or Receiver records; otherwise create them using Create Records.

3. Add validation decisions for missing or invalid booking details.

4. Use Create Records to create the Parcel__c record and populate its sender, receiver and parcel fields.

5. Generate or assign a unique tracking number using a suitable Salesforce-supported approach, and ensure it cannot duplicate an existing number.

6. Show a success screen with the tracking number. Save, activate and test both valid and invalid submissions.

Expected result

A successful booking creates the expected records and returns a unique tracking number to the user.

Complete this step and verify the expected result before moving to the next step.
