SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 05 OF 10

Build Delivery Assignment and Status Update Flows

Give administrators a way to assign deliveries and delivery agents a way to record progress.

What to do

1. Create a flow that runs when a parcel or delivery record is created or updated, or create a Screen Flow for admin assignment.

2. Add logic to select or record the delivery agent and update the related Delivery__c record.

3. Define consistent statuses such as Booked, Picked Up, In Transit, Out for Delivery, Delivered and Failed Delivery Attempt.

4. Create a delivery-agent screen or controlled record page for selecting the new status and entering delivery notes.

5. Use a record-triggered flow to update the parcel's current status when the related delivery status changes, where appropriate.

6. Test assignment, each status transition and unsuccessful delivery attempts.

Expected result
An administrator can assign a delivery, and an agent can update its progress with the parcel record reflecting the latest status.

Complete this step and verify the expected result before moving to the next step.
