SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 07 OF 10

Create the Agentforce AI Agent

Set up the conversational assistant that will help customers with supported parcel tasks.

What to do

1. Open Agentforce or Agents in Salesforce Setup, depending on your org interface.

2. Create a new agent and choose the appropriate agent type and channel available in your org.

3. Give it a clear name, such as Swift Ship Assistant.

4. Write instructions describing its role: help with parcel booking, tracking and delivery questions.

5. Create topics or agent capabilities for the tasks the project supports.

6. Add guidance to ask for a tracking number when needed, protect customer information and hand off unsupported requests.

7. Save, configure access and test the agent in its preview environment.

> **Expected result**
> The agent can understand the intended parcel-related requests and respond within its configured scope.

Complete this step and verify the expected result before moving to the next step.
