SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 08 OF 10

Connect the Agent to Salesforce Actions and Flows

Allow the agent to perform approved tasks by invoking Salesforce automation and actions.

What to do

1. Identify the flows or actions the agent needs, such as Find Parcel by Tracking Number, Create Parcel Booking or Submit Delivery Change Request.

2. Confirm that each flow has well-defined input and output variables and handles errors safely.

3. Expose the supported flows as Agentforce actions using the configuration available in your org.

4. Add each action to the relevant agent topic and describe when it should be used.

5. Set permissions and verify that the agent runs with the intended access. Require customer verification before revealing private parcel details or changing delivery information.

6. Test each action from a conversation, including invalid tracking IDs, missing inputs and unauthorized requests.

> **Expected result**
> The agent can invoke the correct Salesforce action and report the actual result rather than claiming an action succeeded when it did not.

Complete this step and verify the expected result before moving to the next step.
