Test Customer, Agent and Admin Scenarios

Verify that each user role can complete its tasks and cannot access information outside its permissions.

What to do

1. Customer tests: create a booking, receive a tracking number, track a parcel and view allowed delivery information.

2. Delivery agent tests: view assigned deliveries and update status or delivery notes.

3. Admin tests: review parcel records, assign agents and monitor delivery progress.

4. Negative tests: use an unknown tracking number, omit required fields, enter invalid values and attempt an unauthorized action.

5. Test notifications and confirm they are triggered only by the intended events.

6. Record defects, fix them and repeat the affected tests. Keep a simple test-results sheet for the project demonstration.

Expected result
The main workflows pass for all three roles, and privacy, validation and error handling behave as expected.
