SWIFT SHIP TRACKER

IMPLEMENTATION GUIDE · STEP 10 OF 10

Prepare the Final Project Demonstration

Prepare a short end-to-end walkthrough that proves the booking, tracking, delivery and AI features work together.

What to do

1. Prepare sample customer, sender, receiver, parcel and delivery-agent records.

2. Start with the customer booking interface and create a new parcel.

3. Show the generated tracking number and the saved Salesforce records.

4. Open the Swift Ship Assistant and ask it to track the newly created parcel.

5. Switch to the delivery-agent view and update the delivery status.

6. Return to the customer conversation or tracking view and show the updated status.

7. Finish with the admin view, highlighting records, automation and reports. Prepare a backup set of screenshots in case the demo environment is unavailable.

Expected result
The demonstration tells one complete story: a parcel is booked, tracked, updated by an agent and managed through Salesforce with Agentforce assistance.

Complete this step and verify the expected result before moving to the next step.
